Climatic evidence suggests that people were probably protecting their feet from frigid conditions by about 50,000 years ago. Changes in foot shape and strength indicate that people were using footwear with substantial soles by about 30,000 years ago. However, the earliest examples of actual footwear, a pair of sandals found in California (U.S.), date to only about 9,000 years ago.

During the Kassite period (c. 1600–1200 BC) in Mesopotamia, soft shoes were introduced by mountain people on the border of Iran who ruled Babylonia during that time. This first type of shoe was a simple wraparound of leather.

And, until a hundred years or so ago, there were no left and right designs to shoes. Practical people, though, would switch shoes each day so that the shoes wore evenly on either side.

Early man made his own shoes, and some people continued to make shoes for themselves and their families until recent times. Shoemaking, however, soon became a job that everyone who could afford to left to skilled workers.

Until the last couple of centuries, the design of men’s shoes was given more attention than those for women. Women’s feet were often hidden beneath long skirts. Men had a greater variety of styles and ornaments; women usually wore shoes of more delicate materials. Working people needed sturdy, practical footwear. Wealth people wore shoes that showed they didn’t need to work and, in some cases, even to walk. Children have usually worn smaller versions of adult styles.

One of the foremost men’s shoe fashions in the Middle Ages was the crakow (or Krakow).

Following is a small version of a medieval trepanning operation which was actually used to illustrate the wearing of cracows, pointy medieval shoes (A larger, color version appears at the end of this document.)

Illustration from the Anathomia of Guido da Vigevano (see biographies below)

“Physician and patient wearing crakows”
“Cracow, also spelled crackowe long, pointed, spiked shoe worn by both men and women first in the mid-14th century and then condemned by law. Crakows were named after the city of Kraków (Cracow), Pol., and they were also known as poulaines (Polish). Crakows were admired on the feet of the courtiers of Anne of Bohemia, who married Richard II of England. The exaggerated toes were imitated even in armour.”

Facts about crakow: popularity in Middle Ages, as discussed in ... Facts about crakow; popularity in Middle Ages, ...III enacted a law that the spikes, or points, of shoes should not exceed the length of 2 inches (5 cm),

Guido da Vigevano (c 1280-1349) ~ Mondino dei Luzzi and Guido da Vigevano * are two great names in the history of medieval anatomy, the former by his Anothomia Mundini
Guido da Vivgevano was born in Lombardy towards 1300 and was the physician to Emperor Henri VII and Jeanne de Bourgogne, Queen of France.

Guido was Italian and technically well versed. He was court-physician of the French king Philipp VI. The surgeons of his time did not have access to anatomical knowledge because they did not know Latin, and could not read the textbooks; this was the reason why anatomy became a type of philosophical exercise. The first official dissection was performed at the University of Bologna by Mondino, a pupil of Taddeo. Although dissection was indirect, being a sort of comment on Galen's texts, Mondino was the most important precursor of modern human anatomy. There were other human anatomists, such as Guido da Vigevano who suspended the corpses so as to be able to dissect them
